## Our guide to hooking up

### Full Kit

The heated jacket has 3 plugs neatly placed in a zipped pocket on the inside front left panel. These plugs provide the power inlet to heat the following garment(s):

WHITE - Heated jacket liner.

BLACK - 12v heated gloves.

YELLOW - Accessories i.e. trousers and/or socks.

The YELLOW plug only provides power when the BLACK lead is connected.

If you are using the jacket without any other Gerbing product and without a temperature controller (not recommended) then the white plug can be connected directly to the battery cable provided.

If using a heated jacket liner only we recommend using a Gerbing Single controller (TCSP) for the jacket only, simply connect the controller between the WHITE plug and the battery cable.

We recommend using a Gerbing Dual Temperature controller (TCDDP) when using multiple items simultaneously, connect this between the WHITE and BLACK plugs, and the battery cable.

Add trousers to the YELLOW accessories port in the jacket liner.

To add socks (without trousers) connect a long Y-cable (provided) from the socks to the YELLOW plug. Alternatively, connect directly into the trousers.

Please note – the jacket power runs on one circuit, and the gloves and/or accessories on a separate circuit. Therefore you can control the heat of the jacket and the gloves (plus trousers/socks) independently. Gloves, trousers and socks will all run at the same temperature setting.

### Just Gloves

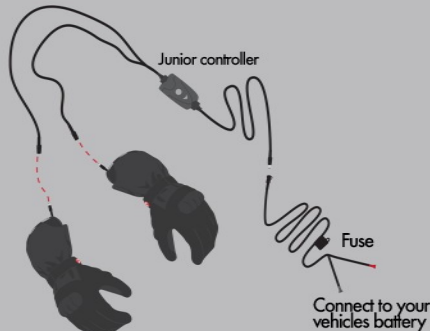

Gloves are supplied with battery hook-up and in-line Junior Temperature controller to adjust the heat when connected to a vehicles battery.

### Just Socks

If not using through your jacket and a dual temperature controller then we strongly recommend purchasing a junior controller to regulate the temperature of the socks.

Not sure what fuse you need to use?

Here is some info on which fuse you need to place into the battery hook-up to run your Gerbing kit. They are all colour coordinated, so it's easy pleasey!
